

IN THE SPECIFICATION

Kindly amend page 10 of the instant specification to add definitions of terms as required in the Action, as shown in the following text presented on a separate page.

Page 10, paragraph beginning on line 24:

Although the present invention is aimed at a FDD (Frequency Division Duplex) mode of operation it can be applied to a TDD (Time Division Duplex) mode if the uplink and downlink channel use different time slots at the same frequency. In the TDD mode the channel will be reciprocal and the need for the signalling of channel information reduced.
